“Urgent call to the World Bank Group to strengthen public health financing and refrain from promoting public-private partnerships in health care”

24 March, 2021

The Covid-19 pandemic has shown that [public investment in health](#) is urgent and crucial for states' obligations to fulfil the right to health for all. The World Bank as well as the World Bank-hosted Global Financing Facility, have been contributors to countries' health systems strengthening efforts with a view on urgent health challenges. However, some aspects of the World Bank contribution to development assistance deeply concern us. In line with the '[Maximizing Finance for Development Strategy](#)', the World Bank Group has been promoting Public-Private Partnerships (PPPs) with commercial companies as a preferred development strategy, including in healthcare, alongside with investments in private healthcare.

We, Wemos and co-signing organisations, strongly urge the World Bank Group to focus on strengthening public health financing, and refrain from promoting PPPs in healthcare because of the associated risks to the public purse in the long run and the risk of worsening existing inequalities.

Evidence-based concerns on PPPs in healthcare

The enclosed position paper '[Risky Business: the promotion of Public-Private Partnerships in healthcare](#)' (Wemos, 2021) and its [Executive Summary](#) analyses the current evidence on the effectiveness of PPPs in healthcare. It indicates that promoting healthcare PPPs in low- and middle-income countries often has a negative effect on achieving equal access to quality key health services for everyone. PPPs in healthcare are more expensive and riskier than public provision, thus contributing to the burden of debt and potentially diverting scarce public resources away from primary healthcare and other urgent needs in the health system. Moreover, PPPs show limited success in addressing access to healthcare of the poorest and most vulnerable populations, and the inflexible PPP contracts constrain already stretched health budgets that need to be responsive to public health needs and crises. Earlier papers have also critically reviewed PPPs in healthcare, such as those published by [ISER](#), [Jubilee Debt Campaign](#), [Latindadd & Eurodad](#), [ODG](#), and [Oxfam](#).

Critical review of PPPs across social sectors

The use of PPPs across sectors has widely been assessed and discouraged by official institutions (such as the [European Court of Auditors](#)), scholars and researchers (see 2021 book edited by [Gideon and Unterhalter](#)), human rights institutions (such as the [African Commission on Peoples' Rights](#)), and civil society organisations (as in the 2017 [PPP manifesto](#) and the 2020 [briefing of the Gender & Development Network](#)). In fact, due to the high cost and complexity of PPPs, European countries like [Spain](#) and [the UK](#), which previously invested in PPPs in healthcare, are now abandoning this type of arrangement.

A 'public first' approach to health financing

As concerned civil society, we call on the World Bank Group, its member countries, and the World Bank-hosted Global Financing Facility to adopt a 'public first' approach to healthcare. This approach implies using all possible ways to expand public resources for health, including official development resources, before resorting to private financing and commercial solutions. As reiterated in the WHO's [evidence-based guidance on health financing](#): to progress towards Universal Health Coverage and health security, policymakers should prioritise public over private financing in healthcare. Actors in development assistance, including the World Bank Group, can support low- and middle-income countries in strengthening the public purse for health and public healthcare provision. This can be achieved, among others, through technical and financial assistance that is free of commercial interest, [tackling tax avoidance](#) and through [debt cancellation](#). This way these countries would truly be supported to realise the right to health and achieve universal and equitable access to healthcare. A first step of this approach would be to stop promoting PPPs as a strategy for healthcare delivery and financing, as long as there is no independent, detailed and locally validated body of evidence that shows a lasting positive impact on fiscal space for health, efficiency, and equitable access.

We would very much appreciate a response on these asks at your earliest convenience, so we can discuss them in more detail.

Thank you for considering this request.

Yours sincerely, on behalf of the undersigned,

Mariëlle Bemelmans
Director Wemos
